

Ideation Phase

Define the Problem Statements

Metric	Details
Date	08 July 2026
Institution	Vishnu Institute of Technology
Project Name	Predictive Risk Clustering and Visual Informatics for Cardiovascular Disease
Maximum Marks	2 Marks

PS-1

-
- **I am:** Clinical Diagnostic Specialist / Cardiologist
I'm trying to: Spot compounding high-risk factor clusters across a patient list rapidly before critical events take place.
- **But:** The multi-variable patient diagnostic data sits scattered and unorganized row-by-row across massive patient history records.
- **Because:** Static medical data spreadsheets are incredibly tedious and time-consuming to read when cross-referencing multiple attributes like age and lifestyle.
- **Which makes me feel:** Frustrated because important preventative business and healthcare decisions become slower, less data-driven, and introduce cognitive visual overload.

PS-2

- - **I am:** Health Informatics Analyst
I'm trying to: Analyze patient preferences, behavioral diagnostic distributions, and lifestyle-wise diagnostic counts using interactive cloud visualizations.
 - **But:** Raw clinical health datasets contain thousands of detailed patient records that are difficult to analyze cleanly without proper visualization wrappers.
 - **Because:** Cluttered, boilerplate user interface templates hide meaningful epidemiological patterns under non-essential corporate text fragments.
 - **Which makes me feel:** Inefficient because valuable clinical correlations may be overlooked, and rigid systems lack simultaneous dual-axis view ports.
-

Problem to Solution Flow

Raw Clinical Dataset ([Heart_new2.csv](#)) → Data Preprocessing & Cleaning → Interactive Tableau Dashboards & Story → Informatics Insights → Better Preventative Clinical Decision Making
